

Definition of Ethics

Name: Isaac Adebayo

Date: February 5th, 2026

Reliable Definition of Ethics

Ethics (philosophical or moral view)

Ethics is the moral subjective view on what is inherently right or wrong, moral or immoral and how this principles shape societal outcome

Who is responsible for enforcing ethical principles (users, government, or service provider)

The deliberation of who is responsible for ensuring ethical principles are followed is always evolving.

However, the three major participants are governmental bodies, the user who data is generated from and service providers that collect various data.

Governmental entities are responsible for enacting laws required to protect data and enforcing violations that impede ethical guidelines.

Service provider are responsible for ethical utilization of data.

Users are autonomous being that ought to provide explicit individual consent or information that pertains to moral and ethical framework

My Definition of Ethics

My definition of ethics is rooted on past philosophical movement particularly the role of ethical principles guided by, Kantian deontology, Feminine ethics, Consequentialism (utilitarianism), Confucianism, Aristotelian ethics and much more. I strongly do not believe ethical principles should be guided based on the majority according to utilitarianism which believe that benefit to the majority outweighs the cost of the minority to maximize the greatest good. This punish the minority (violates their individual right and autonomy and is a form of philosophical martyr by channeling a view that is fundamentally disadvantageous), it is also inherently flawed (social ladder can change drastically both vertically or horizontally in a single or multiple generation and individuals can move up and down this ladder and fit into a majority or minority, therefore if a moral principle is inherently skewed to favor a class of people based on number, the movement across this spectrum become counterintuitive which is a breeding ground for nefarious activities).

I do not hold a strong believe in all form of Aristotelian ethics as I believe it is archaic and outdated. This principles rely on the golden mean and was a core philosophical school of thought by Greek philosophers such as Plato, Socrates and Aristotle and the Stoics. I strongly oppose believe in inherently morality based-ethics by Aquinas who merged Aristotelian philosophy (eudaemonia and religious) doctrine regarding what is good and evil.

I strongly believe that human and cultural bias affects each view of ethics and a western ethical principles (individualistic and autonomous ethics) might not apply to other core ethical principles founded in a different region like in Asia and Africa (Confucianism, Buddhism) which are often interpersonal and collectivistic based ethics. Human religious tendencies or lack of tendencies, historical bias and previous history of subjugation and marginalization do have a strong implicit bias when viewing ethical principles. Along familial background, jealousy, conflicting thoughts, and indifferences also blur the line of ethical principles by disguising true moral intentions if subservience is not complied with as seen as justification in some part of the world regarding honor killing which do not thoroughly incorporate the view of gender based feminine ethics and Kantian deontology regarding autonomy, (this infiltrate the primary relationship (family and close kin).

My subjective definition of ethics will be merging a combination of all form of ethics since all ethical principles all have some advantages and disadvantage and is rooted in promoting the overall good whether it at an individual level or a community level. In a ever changing world, rules and logic are meant to always be revised to account for technological advancement, knowledge acquisition, cultural diversity, information accessibility and global interconnectedness.
