AI Tool Presentation

Hugging Face and Open AI platform

Hugging face is a computation tools for building applications using machine learning. It is also used for natural language processing.

OpenAI is used in generating API keys and using different multimodal models and transformers such as GPT for text chatbot and Soras for video chatbot creator

AI Tool: <https://huggingface.co>

AI Tool: <https://platform.openai.com/chat>

Hugging Face and Open AI platform

Choice of AI Tool:

This tool has its own free version of IDE and multiple models and transformers. It also has multiple libraries such as PyTorch, TensorFlow, Jax, and much more.

There is a free model and cost just a little bit of money for subscription.

OpenAI platform is required to create API keys used for the model LLM. It requires a subscription model and is essential in application of Retrieval Augment Generation training for text retrieval and training of dataset.

Multimodal Chatbot (Gemini and GPT), GitHub

Github and any AI multimodal NLP chatbot such as Gemini, Perplexity or ChatGPT.

Link_github: <https://github.com/isaacadebayo>

Link_gpt: <https://chatgpt.com>

This can lead to lack of integrity, inept critical thinking skills and the inability to find bugs/debugs which is a foundational knowledge of coding.

Github is a open software coding repositories hosting most of the open software involved in Machine Learning, it is useful in identifying latest software of some algorithms such as KERAS

Multimodal Chatbot (Gemini and GPT), GitHub

I chose this tool as it is useful in identifying missing packages in templates such as overleaf.

It can also be used for code debugging but accuracy is subjective and is based on proper prompting techniques.

Overall opinion of the AI Tools discussed above

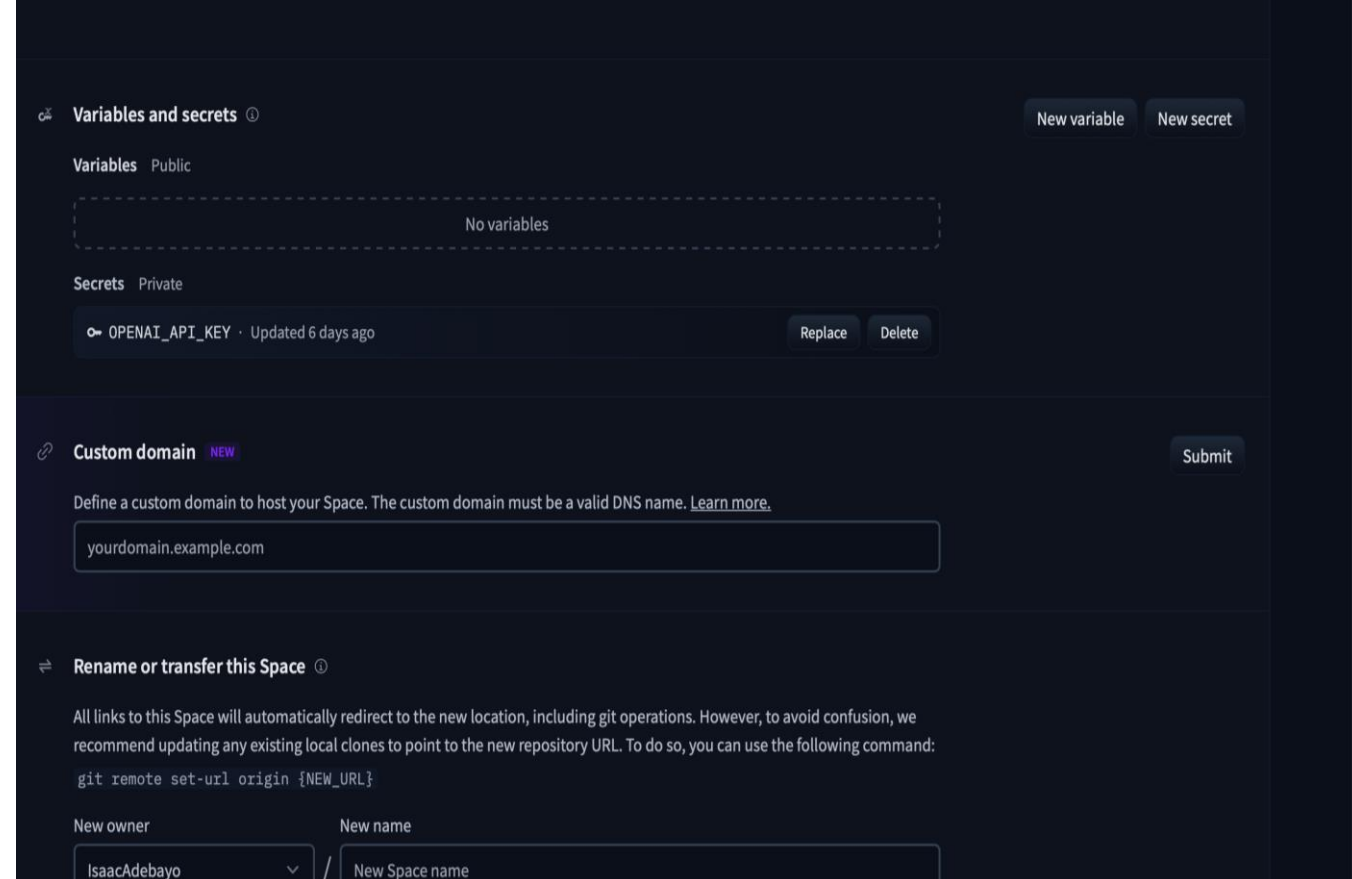

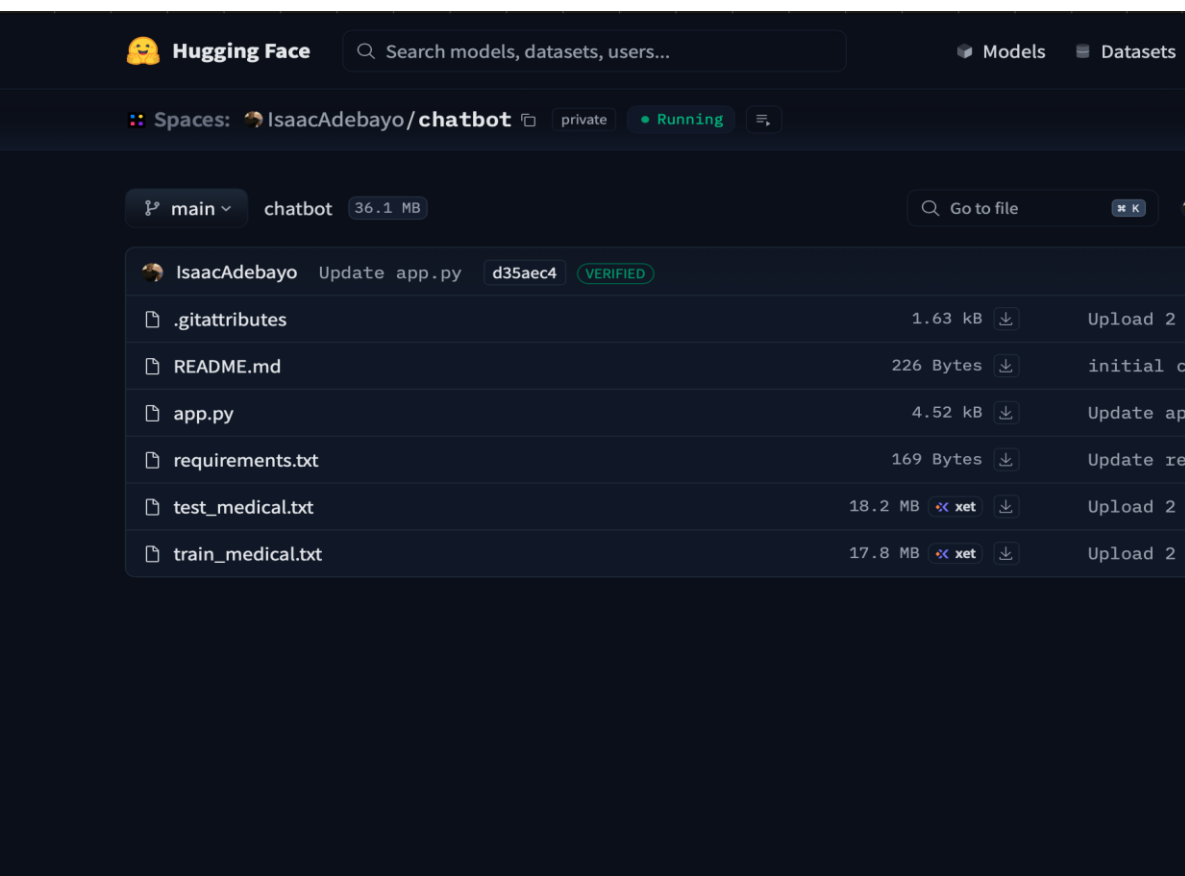

The AI Tools selected are some alternate tools needed to be a successful data scientist, it provides access to the most up to date software on machine learning algorithms (packages imported on hugging face are run and downloaded real time unlike other IDE such as Jupyter notebook that has to be updated periodically or cloud-based platform such as google COLAB which all often have different packages).

It also provide a coding community to discuss and show programing skills and project which can be useful in networking, usage of AI for debugging or finding the appropriate dataset based on prompt engineering on other multimodal AI tools.

Short Demo on Hugging Face

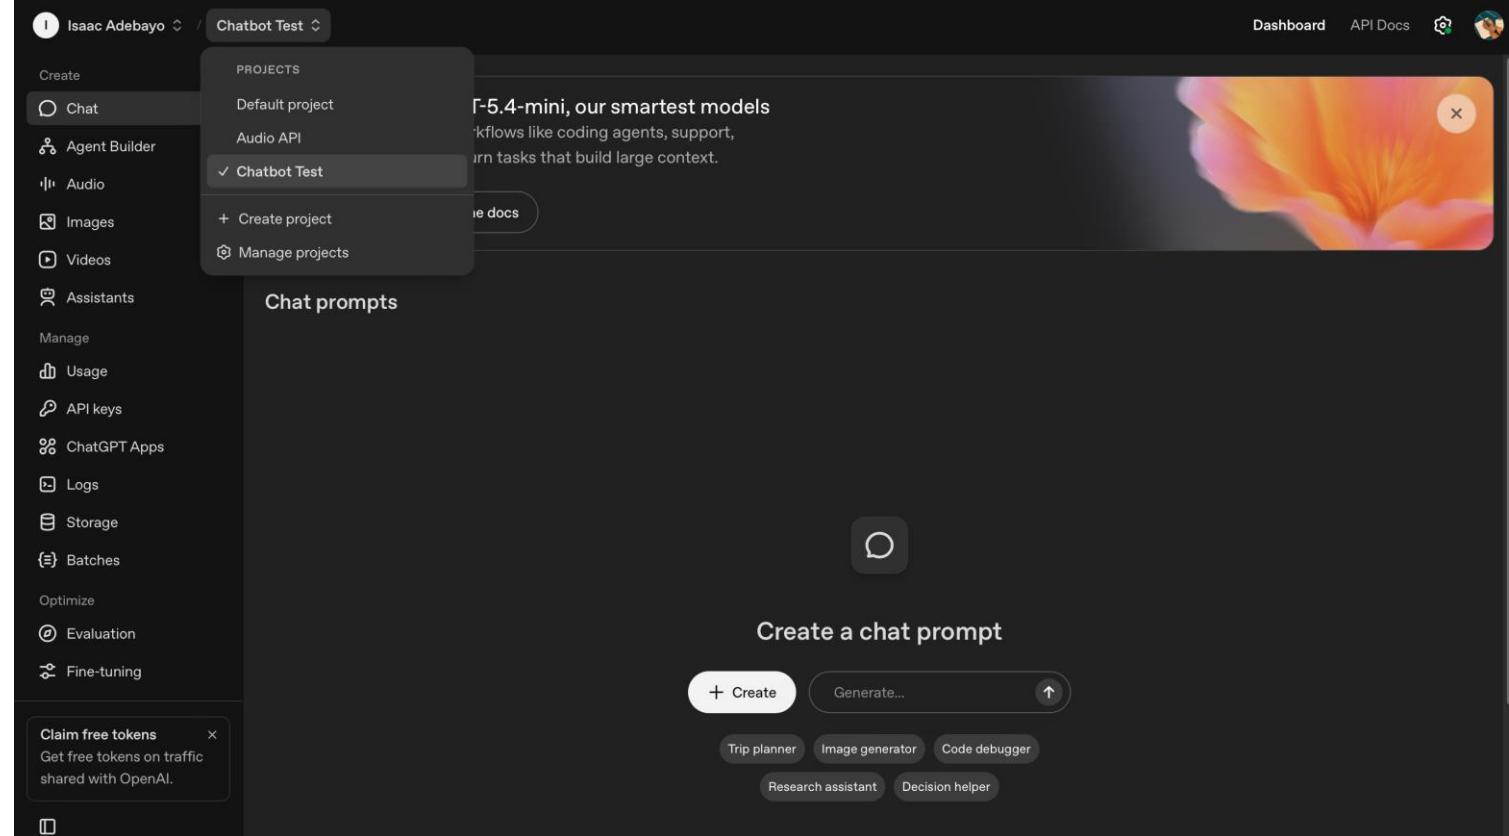

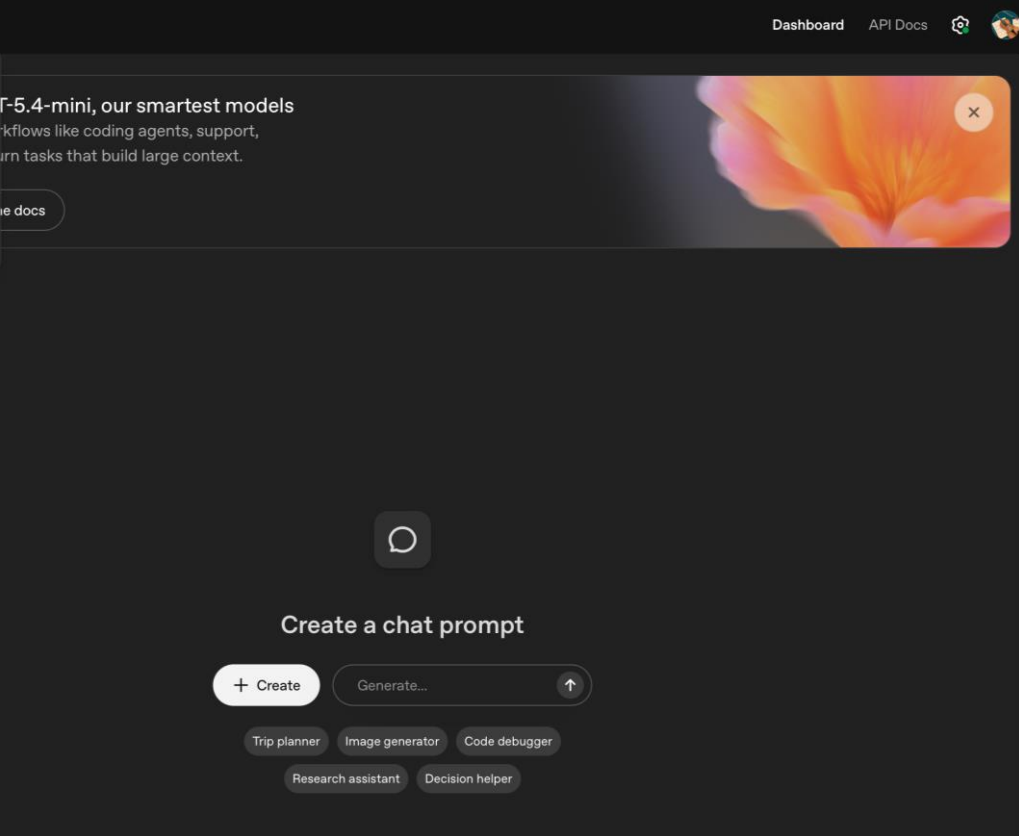

A short demo showing how to use the hugging face to create a new space, save API key and upload file (import files must be stored in a requirements.txt file without just the name and uploaded to main), dataset must also be uploaded to main.

Screen shot of Hugging Face

Creating a new space in main and storing different file types from text files, python files, cvs files and requirement file.

Screenshot of Open AI Platform

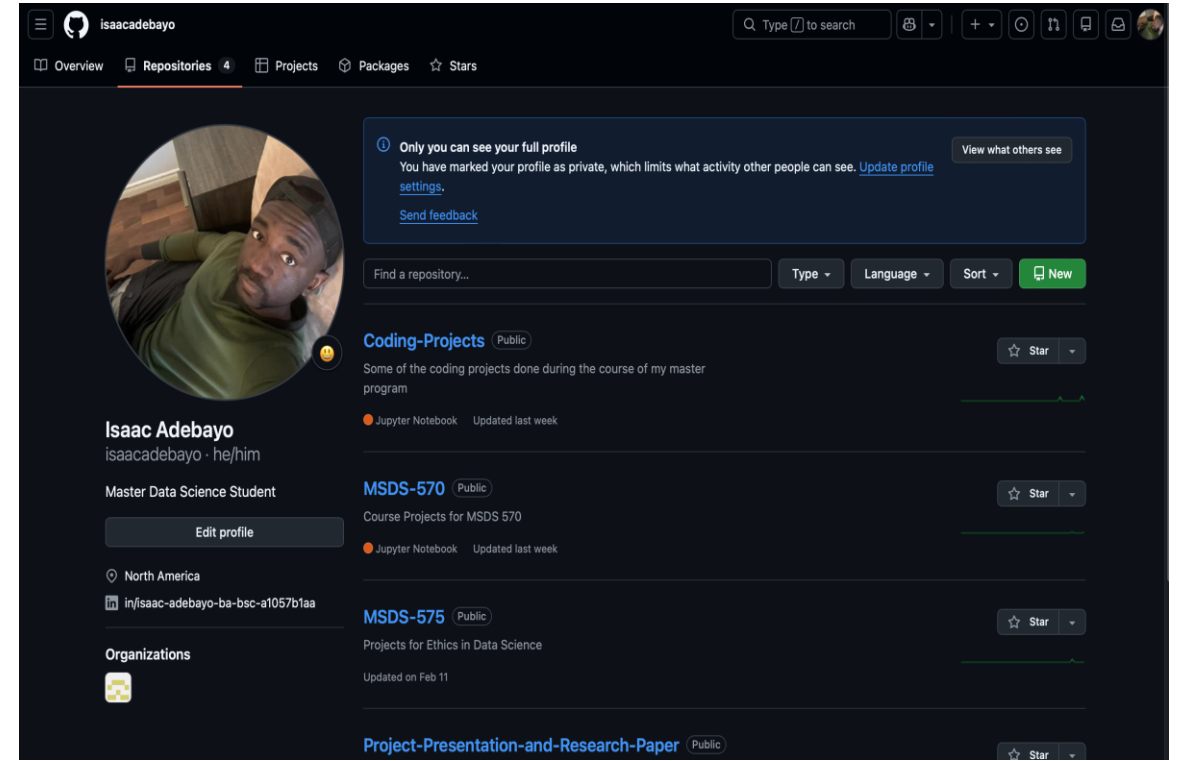

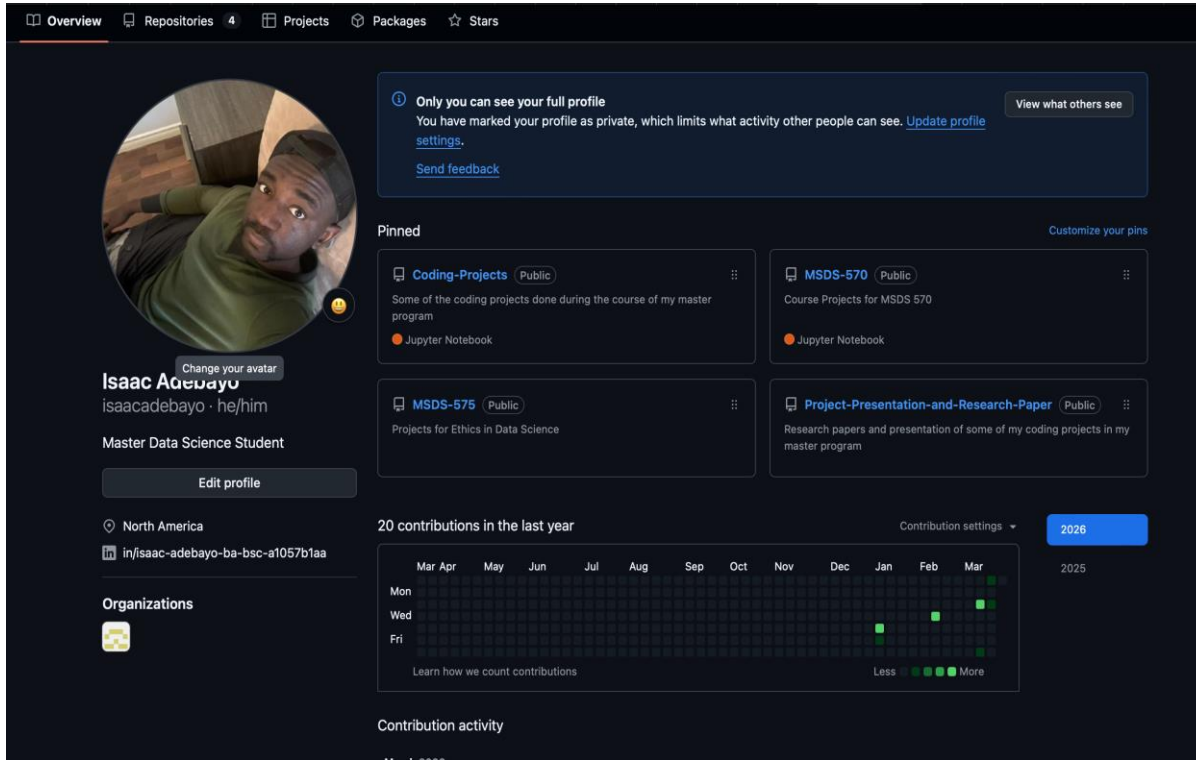

Screen shot visualizing the creation of a new project and creating of a new secret key that can be used to access various API models involved in text, audio and video images

Short Demo on OpenAI platform

A short demo showing how to use the open AI platform (founder of GPT) to create a new API key and delete and revoke keys if they are compromised. A look into different form of transformer model and the appropriate model for digitalized image/videos.

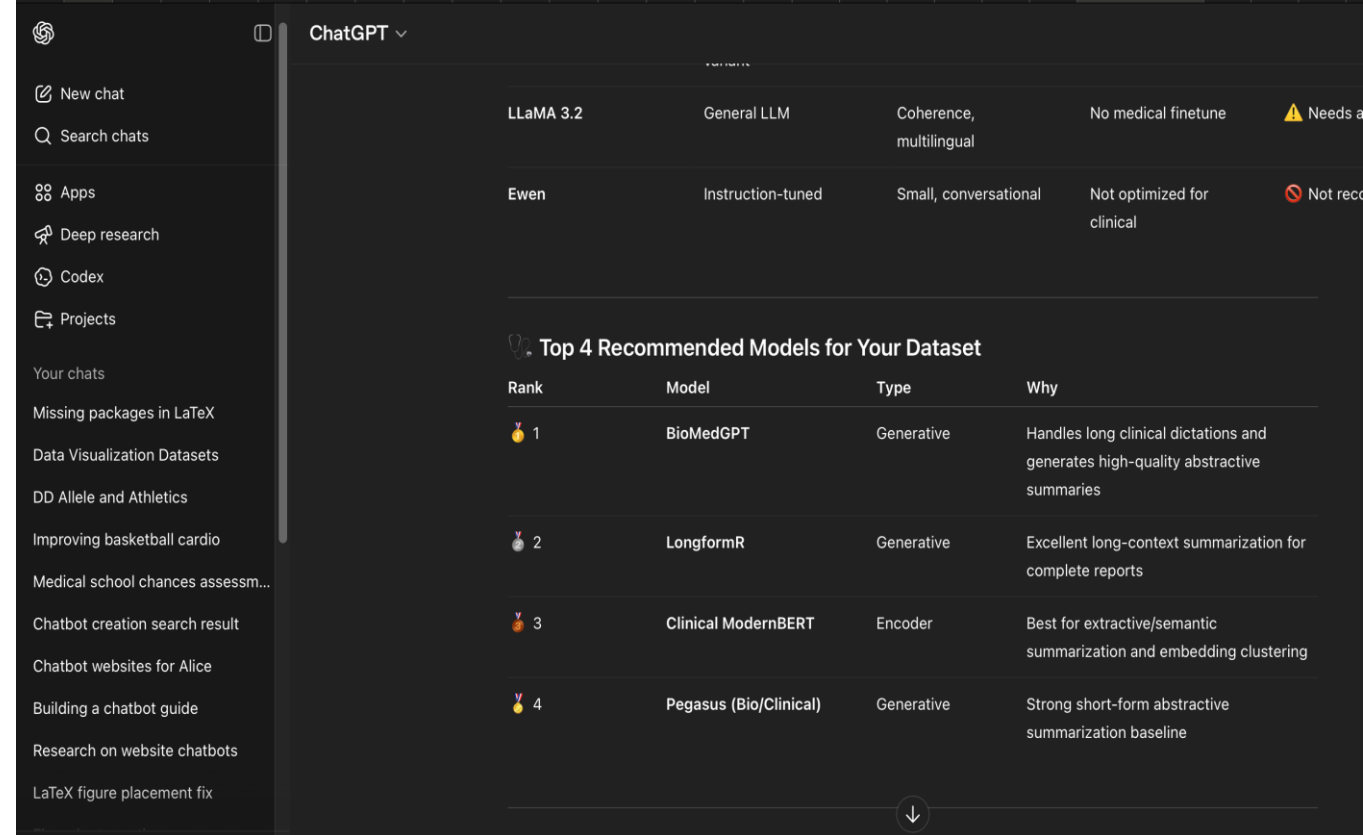

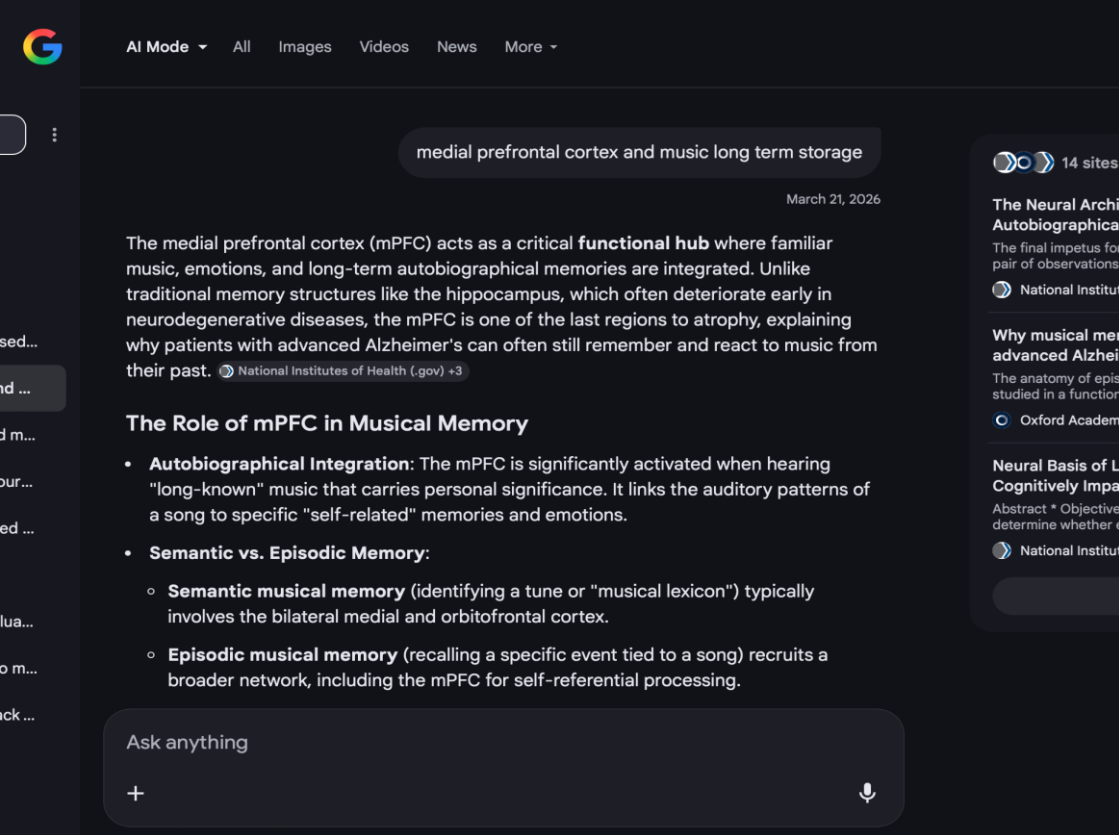

Screen shot of GitHub

GitHub is an environment where programmers, software engineer, data scientist can show their coding projects, contribute to open software development, debug and network with other professionals.

Screen shot of some multimodal AI chatbot (ChatGPT and Gemini)

Prompting techniques and always check and verify citation to prevent hallucination .

It is recommended to create a verified account even if the intention is not to pay for a tier subscription model because it saves an history of text prompt which help developers refer back to prevent result
